

DOT Issues Emergency Order for Stricter Standards: Transporting Crude Oil by Rail.

Train shipments of crude oil are under review across North America after a U.S. emergency order requiring new safety measures aiming at preventing future accidents. The new standards are in response to recent train derailments carrying crude oil.

The U.S. Transportation Department now requires testing and classifying of all crude prior to transportation by rail. The standards are designed to ensure the proper containers are used and safety steps are taken. Some crude must now be reclassified under a higher risk level, triggering requirements such as stronger rail cars that will be less likely to leak or break in an accident.

Pace Analytical has experts that can help meet the new standards.

Full Service Offering with Fast Turnaround Times:

- ✓ A sample collection kit complete with bottles, instructions and prepaid shipping is sent directly to you
- ✓ Testing results are collected and classified
- ✓ A fully compliant Safety Data Sheet is created and sent directly to you

Give us a call, and we can help you get started!
